The Benefits of Meat Research in New Zealand: A Pilot R&D Outcome Review

Foundation for Research, Science and Technology

Wellington, Foundation for Research, Science and Technology, New Zealand, 1997, 360 pp., no ISBN available

This report employs a theoretical framework based on evolutionary economics and new growth theory to identify the wider, indirect and more qualitative benefits of R&D that are not captured by traditional cost-benefit analysis. It consists of interview-based qualitative case studies of 17 commercialised innovations in New Zealand's meat industry, and the lessons drawn from them.
